From Last Time: Arrays

A new variable type that is an **object** that represents an ordered, homogeneous list of data.

- Arrays have many *elements* that you can access using *indices*

Data Structures

Operation

Strings

Arrays

Make a new
one

```
String str = "abc";
```

Get length?

```
str.length()
```

Get element?

```
str.charAt(i)
```

Set element?

Not allowed

Loop?

```
for(int i = 0; i < str.length(); i++)
```

Data Structures

Operation	Strings	Arrays
Make a new one	<code>String str = "abc";</code>	<code>int arr = new int[5];</code>
Get length?	<code>str.length()</code>	<code>arr.length</code>
Get element?	<code>str.charAt(i)</code>	<code>arr[i]</code>
Set element?	<i>Not allowed</i>	<code>arr[i] = 5;</code>
Loop?	<code>for(int i = 0; i < str.length(); i++)</code>	<code>for(int i = 0; i < arr.length; i++)</code>

Creating an Array

```
type[ ] name = new type[length];
```

```
int[ ] numbers = new int[5];
```

<i>index</i>	0	1	2	3	4
<i>value</i>	0	0	0	0	0

Java initializes each element of a new array to its *default value*, which is **0** for `int` and `double`, '`\0`' for `char`, **false** for `boolean`, and **null** for objects.

Creating an Array

Sometimes, we want to hardcode the elements of an array. Luckily, Java has a special syntax for initializing arrays to hardcoded numbers.

type[] name = { elements };

```
// Java infers the array length  
int[] numbers = {5, 32, 12, 2, 1, -1, 9};
```

Accessing Data In An Array

name[*index*] // get element at *index*

- Like Strings, indices go from **0** to the array's **length - 1**.

```
for (int i = 0; i < 7; i++) {  
    println(numbers[i]);  
}  
println(numbers[9]); // exception  
println(numbers[-1]); // exception
```

<i>index</i>	0	1	2	3	4	5	6
<i>value</i>	0	1	2	3	4	5	6

Putting Data In An Array

```
name[index] = value;    // set element at index
```

- Like Strings, indices go from **0** to the array's **length - 1**.

```
int[] numbers = new int[7];
for (int i = 0; i < 7; i++) {
    numbers[i] = i;
}
numbers[8] = 2;    // exception
numbers[-1] = 5;    // exception
```

index	0	1	2	3	4	5	6
value	0	1	2	3	4	5	6

Array Length

Similar to a String, you can get the length of an array by saying

myArray.length

Note that there are *no parentheses* at the end!

Arrays + For Loops = ❤

Just like with Strings, we can use an array's length, along with its indices, to perform cool operations.

For instance, we can read in numbers from the user:

```
int length = readInt("# of numbers? ");
int[] numbers = new int[length];
for (int i = 0; i < numbers.length; i++) {
    numbers[i] = readInt("Elem " + i + ": ");
}
```

Arrays + For Loops = ❤

Just like with Strings, we can use an array's length, along with its indices, to perform cool operations.

For instance, we can *sum up* all of an array's elements.

```
int sum = 0;  
for (int i = 0; i < numbers.length; i++) {  
    sum += numbers[i];  
}  
println(sum);
```

Limitations of Arrays

- An array's length is **fixed**. You cannot resize an existing array:

```
int[] a = new int[4];  
a.length = 10; // error
```

- You cannot compare arrays with == or equals :

```
int[] a1 = {42, -7, 1, 15};  
int[] a2 = {42, -7, 1, 15};  
if (a1 == a2) { ... } // false!  
if (a1.equals(a2)) { ... } // false!
```

- An array does not know how to print itself:

```
println(a1); // [I@98f8c4]
```

Arrays Methods To The Rescue!

- The class `Arrays` in package `java.util` has useful methods for manipulating arrays:

Method name	Description
<code>Arrays.binarySearch(array, value)</code>	returns the index of the given value in a <i>sorted</i> array (or < 0 if not found)
<code>Arrays.copyOf(array, length)</code>	returns a new copy of array of given length
<code>Arrays.equals(array1, array2)</code>	returns true if the two arrays contain same elements in the same order
<code>Arrays.fill(array, value);</code>	sets every element to the given value
<code>Arrays.sort(array);</code>	arranges the elements into sorted order
<code>Arrays.toString(array)</code>	returns a string representing the array, such as "[10, 30, -25, 17]"

2D Arrays (“Matrices”)

WELCOME TO
THE MATRIX!!!!!!

2D Arrays

```
type[ ][] name = new type[rows][columns];
```

```
int[ ][] a = new int[3][5];
```

	0	1	2	3	4
0	a[0][0]	a[0][1]	a[0][2]	a[0][3]	a[0][4]
1	a[1][0]	a[1][1]	a[1][2]	a[1][3]	a[1][4]
2	a[2][0]	a[2][1]	a[2][2]	a[2][3]	a[2][4]

Manipulating 2D Arrays

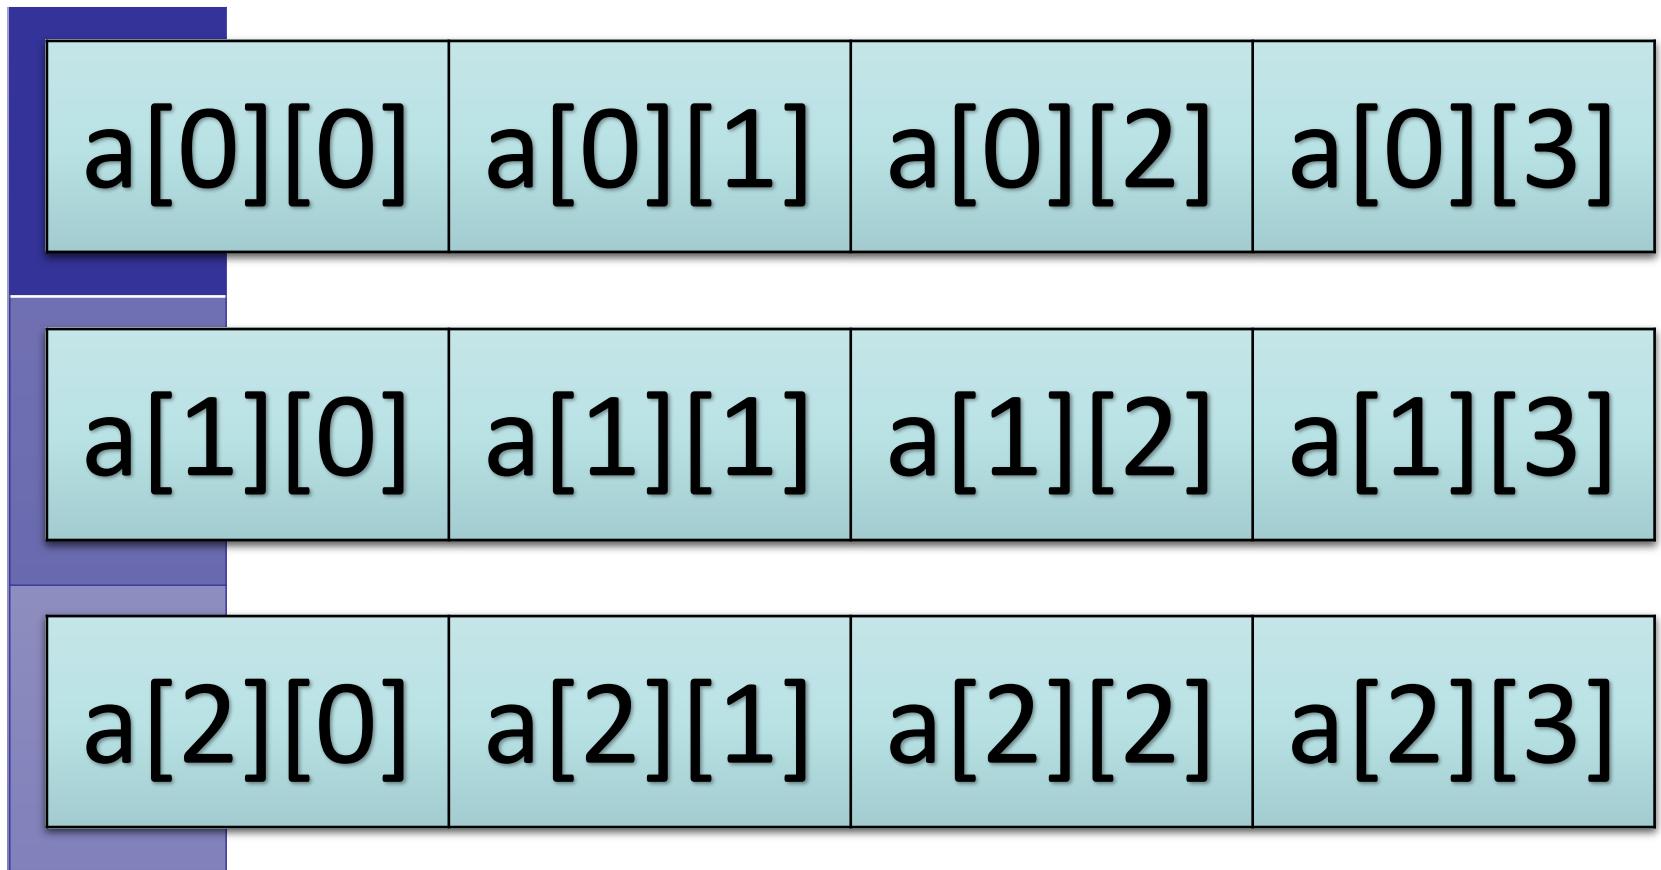

```
name[row][col] // get element at row, col
```

```
name[row][col] = value; // set element at row, col
```

2D arrays are
arrays *of arrays*!

2D Arrays = Arrays of Arrays!

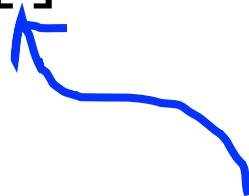

```
int[][] a = new int[3][4];
```

2D Arrays = Arrays of Arrays!

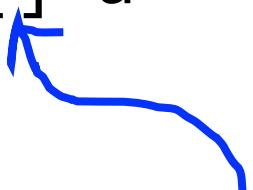

A 2D array is an array where every element is *itself* an array.

```
int[] a = new int[3];
```

“array of” int

```
int[][] a = new int[3][4];
```

“array of” int[]

2D Arrays = Arrays of Arrays!

A 2D array is an array where every element is *itself* an array.

```
int[][] a = new int[3][4];
```

```
...
```

```
int x = a[1][1]; // int at position (1, 1)
```

```
int[] firstRow = a[0]; // 1D array!
```

```
// NOTE: no way to get a single column ☹
```

2D Array Dimensions

How do we get the number of rows of a 2D array using the **length** property? How about the number of columns?

a[0][0]	a[0][1]	a[0][2]	a[0][3]
a[1][0]	a[1][1]	a[1][2]	a[1][3]
a[2][0]	a[2][1]	a[2][2]	a[2][3]

2D Array Dimensions

You can get the number of rows in a 2D array by saying:

```
arr.Length // # rows in our 2D array
```

Since the length of each row is the same, you can get the number of columns in a 2D array by saying:

```
arr[0].Length // # entries in row 0 ( = # cols)
```

2D Arrays + For Loops = ❤

We can use **double for-loops** to loop over each row, and then each column, in a 2D array.

```
int[][] arr = ...
for (int row = 0; row < arr.length; row++) {
    for (int col = 0; col < arr[0].length; col++) {
        // do something with arr[row][col];
    }
}
```

	0	1	2	3
0	75	61	83	71
1	94	89	98	91
2	63	54	51	49

“row-major” order

Practice: 2D Arrays

- Q: What is the array state after the code below?

```
int[][] a = new int[4][3];
...    // fill with data at right
for (int r = 1; r < 4; r++) {
    for (int c = 0; c < 3; c++) {
        a[r][c] += a[r - 1][c];
    }
}
//
```

r\c	0	1	2
0	1	2	3
1	1	2	3
2	1	2	3
3	1	2	3

A.

	0	1	2
0	1	3	5
1	1	3	5
2	1	3	5
3	1	3	5

B.

	0	1	2
0	1	3	6
1	1	3	6
2	1	3	6
3	1	3	6

C.

	0	1	2
0	1	2	3
1	2	4	6
2	2	4	6
3	2	4	6

D.

	0	1	2
0	1	2	3
1	2	4	6
2	3	6	9
3	4	8	12

Limitations of 2D Arrays

- Unlike 1D arrays, you *cannot compare 2D arrays with `Arrays.equals`.* You must use `Arrays.deepEquals`.

```
int[][] a1 = ...  
int[][] a2 = ...  
if (Arrays.deepEquals(a1, a2)) { ... }
```

- A 2D array does not know how to print itself:

```
int[][] a = new int[rows][cols];  
println(a); // [[I@8cf420  
println(Arrays.toString(a)); // [[I@6b3f44,[I@32c2a8]...  
  
// [[0, 1, 2, 3, 4], [1, 2, ...  
println(Arrays.deepToString(a));
```

Summary: 2D Arrays

- Make a new 2D array

```
type[][] name = new type[rows][columns];
```

- Get and set values using bracket notation

```
name[row][col]           // get elem at row,col
```

```
name[row][col] = value; // set elem at row,col
```

- Get the number of rows and columns

```
arr.length    // # rows
```

```
arr[0].length // # columns
```

- Iterate over a 2D array using a double for-loop

```
for (int row = 0; row < arr.length; row++) {  
    for (int col = 0; col < arr[0].length; col++) {  
        // do something with arr[row][col];  
    }  
}
```

Plan for Today

- Recap: Arrays
- 2D Arrays
- Images as 2D Arrays
- Modifying Images
- Practice: Brighten, Grayscale

Images

Images are just grids (2D arrays) of pixels! Pixels are just integer values that have red, green, and blue components (each between 0 and 255).

Images as 2D Arrays

We can get a GImage as a 2D array of pixels.

```
GImage img = new GImage("res/snowman.jpg");
int[][] pixels = img.getPixelArray();
int pixel = pixels[0][0]; // top-left pixel
```

Example: Pointillism

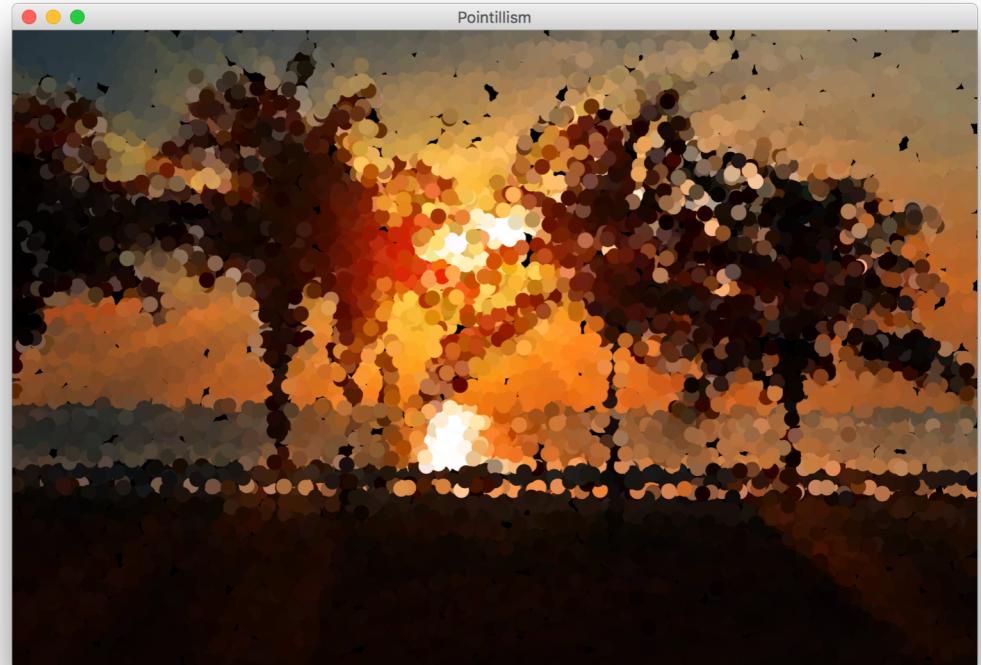

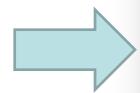

Pointillism is an art style where many small dots of color are combined to make a larger image.

A Sunday on La Grande Jatte, Georges Seurat

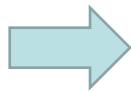

Example: Pointillism

Pointillism is an art style where many small dots of color are combined to make a larger image.

Example: Pointillism

Pointillism is an art style where many small dots of color are combined to make a larger image.

Example: Pointillism

Pointillism is an art style where many small dots of color are combined to make a larger image.

Repeat many times:

1. Pick a random pixel from an image
2. Find the pixel's color
3. “Paint” a large brush stroke of that color in the corresponding location

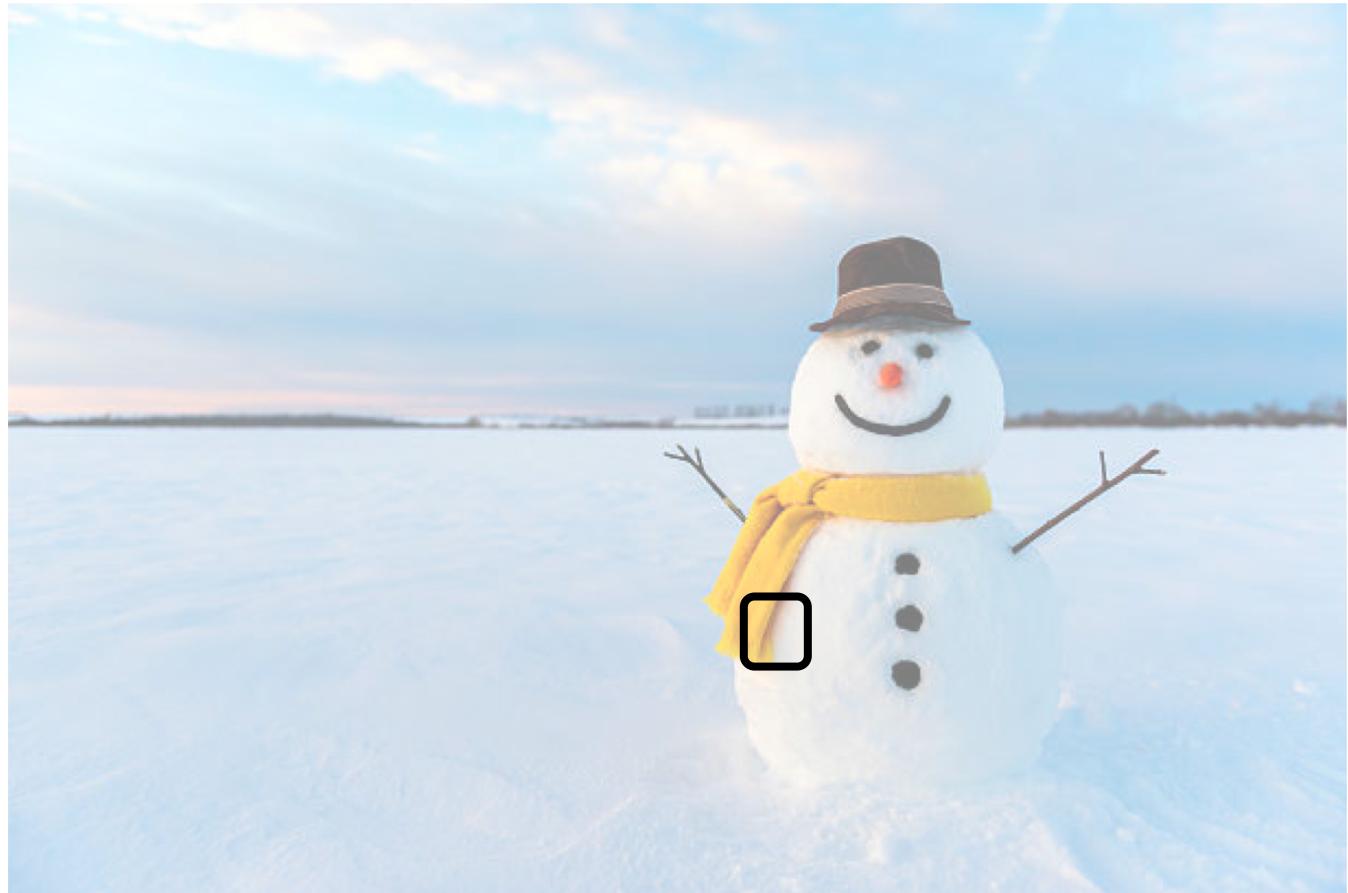

Example: Pointillism

Example: Pointillism

c = 46

r = 36

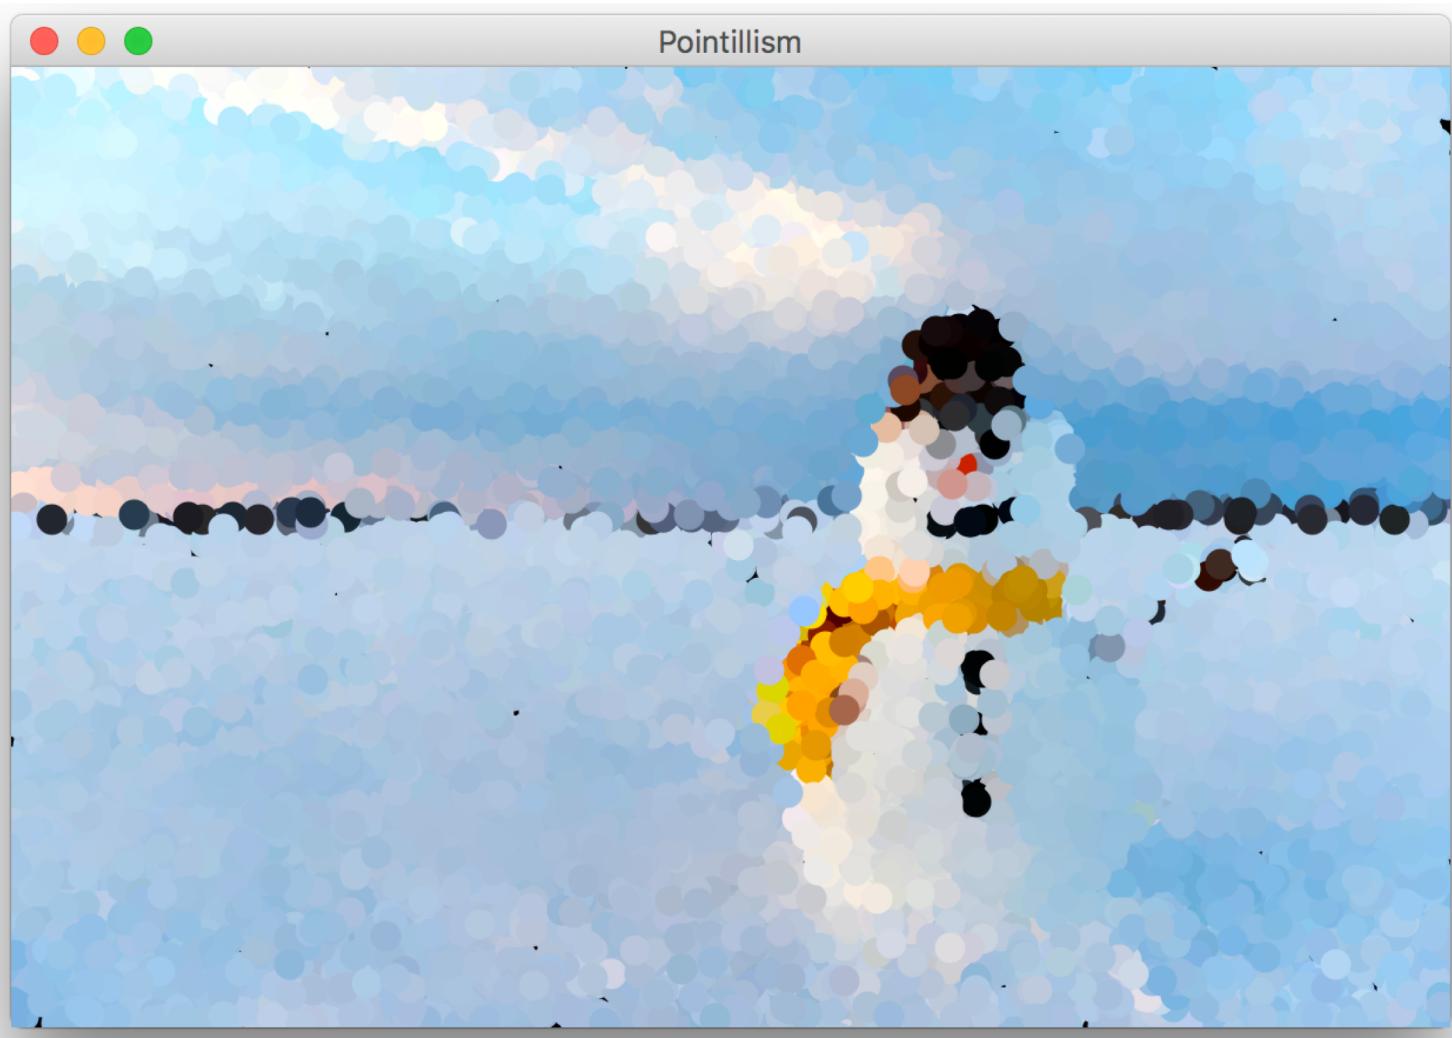

Example: Pointillism

c = 46

r = 36

Example: Pointillism

Example: Pointillism

```
GImage snowman = new GImage("res/snowman.jpg");
int[][] pixels = snowman.getPixelArray();
int rows = pixels.length;
int cols = pixels[0].length;

for (int i = 0; i < NUM_SAMPLES; i++) {
    int c = RandomGenerator.getInstance().nextInt(cols);
    int r = RandomGenerator.getInstance().nextInt(rows);
    int pixel = pixels[r][c];
    Color color = new Color(pixel);
    addColoredCircle(r, c, color);
}
```

Example: Pointillism

```
GImage snowman = new GImage("res/snowman.jpg");
int[][] pixels = snowman.getPixelArray();
int rows = pixels.length;
int cols = pixels[0].length;

for (int i = 0; i < NUM_SAMPLES; i++) {
    int c = RandomGenerator.getInstance().nextInt(cols);
    int r = RandomGenerator.getInstance().nextInt(rows);
    int pixel = pixels[r][c];
    Color color = new Color(pixel);
    addColoredCircle(r, c, color);
}
```

Example: Pointillism

```
GImage snowman = new GImage("res/snowman.jpg");
int[][] pixels = snowman.getPixelArray();
int rows = pixels.length;
int cols = pixels[0].length;

for (int i = 0; i < NUM_SAMPLES; i++) {
    int c = RandomGenerator.getInstance().nextInt(cols);
    int r = RandomGenerator.getInstance().nextInt(rows);
    int pixel = pixels[r][c];
    Color color = new Color(pixel);
    addColoredCircle(r, c, color);
}
```

Example: Pointillism

```
GImage snowman = new GImage("res/snowman.jpg");
int[][] pixels = snowman.getPixelArray();
int rows = pixels.length;
int cols = pixels[0].length;

for (int i = 0; i < NUM_SAMPLES; i++) {
    int c = RandomGenerator.getInstance().nextInt(cols);
    int r = RandomGenerator.getInstance().nextInt(rows);
    int pixel = pixels[r][c];
    Color color = new Color(pixel);
    addColoredCircle(r, c, color);
}
```

Example: Pointillism

```
GImage snowman = new GImage("res/snowman.jpg");
int[][] pixels = snowman.getPixelArray();
int rows = pixels.length;
int cols = pixels[0].length;

for (int i = 0; i < NUM_SAMPLES; i++) {
    int c = RandomGenerator.getInstance().nextInt(cols);
    int r = RandomGenerator.getInstance().nextInt(rows);
    int pixel = pixels[r][c];
    Color color = new Color(pixel);
    addColoredCircle(r, c, color);
}
```

Example: Pointillism

```
GImage snowman = new GImage("res/snowman.jpg");
int[][] pixels = snowman.getPixelArray();
int rows = pixels.length;
int cols = pixels[0].length;

for (int i = 0; i < NUM_SAMPLES; i++) {
    int c = RandomGenerator.getInstance().nextInt(cols);
    int r = RandomGenerator.getInstance().nextInt(rows);
    int pixel = pixels[r][c];
    Color color = new Color(pixel);
    addColoredCircle(r, c, color);
}
```

Example: Pointillism

```
GImage snowman = new GImage("res/snowman.jpg");
int[][] pixels = snowman.getPixelArray();
int rows = pixels.length;
int cols = pixels[0].length;

for (int i = 0; i < NUM_SAMPLES; i++) {
    int c = RandomGenerator.getInstance().nextInt(cols);
    int r = RandomGenerator.getInstance().nextInt(rows);
    int pixel = pixels[r][c];
    Color color = new Color(pixel);
    addColoredCircle(r, c, color);
}
```

Example: Pointillism

```
// Assume canvas is exactly image size
private void addColoredCircle(int r, int col, Color c) {
    double size = CIRCLE_RADIUS * 2;
    G0val circle = new G0val(size, size);
    circle.setFilled(true);
    circle.setColor(c);
    add(oval, col - CIRCLE_RADIUS, r - CIRCLE_RADIUS);
}
```

Plan for Today

- Recap: Arrays
- 2D Arrays
- Images as 2D Arrays
- **Modifying Images**
- Practice: Brighten, Grayscale

Red, Green and Blue in one int?

Images *encode* the R, G, and B values of a pixel into a single integer between 0 and 255. You can convert between this **pixel value** and the individual **RGB values**.

```
int[][] pixels = image.getPixelArray();
int px = pixels[0][0];
int red = GImage.getRed(px);
int green = GImage.getGreen(px);
int blue = GImage.getBlue(px);
```

Creating New Pixels

Images *encode* the R, G, and B values of a pixel into a single integer between 0 and 255. You can convert between this **pixel value** and the individual **RGB values**.

You can also create pixels with your own RGB values.

```
int r = ...  
int g = ...  
int b = ...  
int pixel = GImage.createRGBPixel(r, g, b);
```

Images as 2D Arrays

We can get a GImage as a 2D array of pixels, and modify it any way we want. Then, we can create a new GImage with the modified pixels.

```
GImage img = new GImage("res/snowman.jpg");
int[][] pixels = img.getPixelArray();
... // (modify pixels)
img.setPixelArray(pixels); // update image

// or make a new GImage
GImage newImg = new GImage(pixels);
```

Modifying Image Pixels

- There are many cool image algorithms based around modifying individual pixels in an image: grayscale, brighten, normalize, remove red-eye...

grayscale

zoom

GImage Pixel Methods

```
GImage img = new GImage("res/snowman.jpg");
```

Method name	Description
<code>img.getPixelArray()</code>	returns pixels as 2D array of ints, where each int in the array contains all 3 of Red, Green, and Blue merged into a single integer
<code>img.setPixelArray(array);</code>	updates pixels using the given 2D array of ints
<code>GImage.createRGBPixel(r, g, b)</code>	returns an int that merges the given amounts of red, green and blue (each 0-255)
<code>GImage.getRed(px)</code> <code>GImage.getGreen(px)</code> <code>GImage.getBlue(px)</code>	returns the redness, greenness, or blueness of the given pixel as an integer from 0-255

Recap: Modifying Pixels

- **Extract** pixel RGB colors with `GImage.getRed/Blue/Green`.

```
int red    = GImage.getRed(pixels[0][0]);      // 0-255  
int green = GImage.getGreen(pixels[0][0]);     // 0-255  
int blue   = GImage.getBlue(pixels[0][0]);     // 0-255
```

- **Modify** the color components for a given pixel.

```
red = 0;    // remove redness
```

- **Combine** the RGB back together into a single int.

```
pixels[0][0] = GImage.createRGBPixel(red, green, blue);
```

- **Update** the image with your modified pixels when finished.

```
image.setPixelArray(pixels);
```

Changing Image Size

- Destination image is same size → often modify array in place.
- Destination image is different size → need a new array.
- Example: **Half the size** of an image.

```
int[][] pixels = img.getPixelArray();
int[][] smaller = new int[pixels.length / 2]
                  [pixels[0].length / 2];
...
// set to be the pixels of 'smaller'
img.setPixelArray(smaller);
```
